Dr. Antoinette Muntjewerff, 'Using the Think-Aloud Method to Gather Data on What it Takes to Comprehend a Legal Decision', *ReM* 2014-12, p.

1 Introduction

An empirical study is set out in which both law students and legal practitioners are engaged in comprehending a legal decision while thinking aloud. This study is carried out to examine how novices, expert beginners and experts actually comprehend a legal decision. We want to find out what difficulties are experienced and what may account as causes. In the Dutch legal system decisions by judges are a major source of law. So it is important that law students read, structure and analyse legal decisions. However, reading and understanding a decision does not go without saying. Observations with first year law students reading decisions showed that they experience difficulties with seeing through the composition of the decision, with reconstructing the argument structure and with determining the legal significance of the decision¹ We need to gain insight in what it takes to comprehend a legal decision for designing instructions for effectively and efficiently learning this task. The main focus of this article is on the experimental design of the empirical study. We introduce the experimental design and our approach for analysing the protocols.

2 Experimental design

We want to find out how novices, expert beginners and experts comprehend a legal decision.² We therefor ask our subjects to work on two legal decisions while thinking aloud. We start with a short introduction on the method employed followed by a description of the materials and the subjects involved.

2.1 The Think-Aloud Method

The method employed to explore novice, expert beginners and expert behaviour is to collect verbal data by asking novices, expert beginners and experts to work on a legal decision and instruct them to ‘think aloud’, while everything they say is recorded. These recordings (protocols) are then transcribed and analysed. This method is referred to as the Think-Aloud Method. This use of verbal data collected by introspection already has a successful history in the area of problem solving (see, for instance, Selz 1922; De Groot 1946/1965; Newell & Simon 1972; Elshout 1976; Elshout-Mohr 1976; Mettes & Pilot 1980; Snoek 1989; Muntjewerff 2001).

There are two vital issues in gathering and analysing verbal reports. The first issue relates to the (a priori) validity of self-report data. The second issue relates to the need of an interpretation theory for analysing the data. That introspection is not without problems is related to the fact that not all cognitive processes can be reported verbally, because, for instance, they occur very rapidly or because they are difficult to verbalize. This will lead to ‘gaps’ in the verbal reports. Therefore it has been suggested that the problems that may arise with introspection should be made explicit beforehand in the form of a model or ‘theory’ about these phenomena (see, e.g., Elshout 1976; Ericsson & Simon 1980; Breuker 1982; Ericsson & Simon 1984).

The model of Ericsson & Simon (1980) intends to explain and predict under what conditions verbal report influences task performance, under what conditions verbal report is more or less complete and under what conditions verbal report is in accordance with other data collected from the same task performance (valid).

‘Our purpose in presenting a specific processing model is to aid us in interpreting verbal data obtained from subjects and the relation of their verbal to other behaviour. Since the data (including the verbal data) are gathered to test theories about the human information processing system, we are engaged in something of a bootstrap operation. We need a model to interpret data that are to be used to test the model’ (Ericsson & Simon 1980, p. 222-223).

Breuker adopts this view, though he claims that the model of self-report

‘(...) should be conceived as part of the model that is used to interpret (analyse) the protocols’ (Breuker 1982, p. 116).

We in turn will adopt Breuker’s approach. The verbal data (protocols) gathered should be described or explained on the basis of a theory or interpretation model. In order to analyse the protocols it is necessary

to have already some ideas about what to look for in the protocols, as protocols do not speak for themselves.

Therefore the first step is to construct and formulate a theory to describe the categories and operations which may be relevant in performing the task. This theory is called an interpretation theory, because it is used to interpret statements in the protocols.

Secondly a model of self-report can be described within the framework of the interpretation theory as suggested by Breuker (1982). Not all internal events can be verbalized all the time, due to the fact that not all inner events can be observed by the performer and that although an event may be observed by the performer it may be hard to describe. Using verbal data in comprehending a legal decision is comparable with the use of verbal data in other problem solving tasks (e.g., chess). These tasks are characterized by the fact that the categories and rules are a closed but not automated world. These reasoning tasks show relatively slow thinking and the processes are rather easy traceable. However, subjects have the impression that their minds are working at high speed.

The third step consists of the translation of the protocols in terms of the interpretation theory, i.e. assigning formulas from the interpretation theory to the statements (coding). In analysing protocols many things can go wrong. It may be that the interpretation categories are inadequate, which will lead to a too superficial description of the cognitive processing, or the analysis may be too detailed.

Protocols also contain statements that are not direct reflections of the task at hand. Irrelevant statements may not cause problems, however, incomplete statements will, because there may be statements that are multi-interpretable by providing insufficient context, or the experimenter may have been too anxious not to interfere with the self-report to ask for clarifications. There may also be real gaps in the protocols, because the report goes slower than the actual processing. Gaps may be caused by forgetting (time between processing and report) or by intermediate processes that are not reportable; therefore protocols may have a too rational appearance.

We gathered our protocols by instructing the subjects to comprehend two legal decisions while expressing everything they were thinking. These verbal protocols are used as the raw data gathered about the problem solving process. However, to be able to see the implications for theories on comprehending legal decisions these protocols need substantial interpretation and analysis.

To summarize the activities we have to carry out in the experiment:

- gather data:
 - select materials;
 - select subjects;
- analyse data:
 - construct or formulate an interpretation theory;
 - describe model of self-report;
 - code protocols (translate protocols in terms of interpretation theory).

To be able to gather the data we have to select the materials, being the legal decisions to be comprehended by the subjects, and the subjects to comprehend these legal decisions.

2.2 Materials

Two legal decisions are presented to the subjects. Both decisions are appropriate for the subjects to solve not being too easy or too difficult. Both decisions are representative examples of problems in law.

The first decision is Supreme Court 24 October 1978, ECLI:NL:HR:1978:AC6373 (Uitzendburo Cito (Cito Employment Agency)). The second decision is Supreme Court 23 October 1984, ECLI:NL:HR:1986:AC8567 (Bijlmer Noodweer (Bijlmer Self Defence)). Both decisions are presented to the subjects in full leaving out the conclusion of the Advocate-General and the annotation.

2.3 Subjects

The subjects in the experiment are five first year law students (beginners), five third year law students (expert beginners) and five legal practitioners (experts). The students all study law at the Faculty of Law of the University of Amsterdam.

The students were asked to volunteer in the experiment. Two of the legal experts are working in the field of criminal law, two are working in the field of civil law, and one is working in the field of administrative law.

3 Running the experiment

The experiment in which law students are asked to solve two legal cases while thinking aloud is carried out in three periods. The first period ran from 2 November 2011 until 17 November 2011 and

concerned expert-beginners, the second period is planned from 22 October 2015 until 1 November 2015 and will concern novices. The five legal experts protocols will be gathered in the period from 1 until 29 March 2015.

3.1 Setting

Each student is invited to the Faculty of Law on a specific date and time to participate in the experiment. The room used is a standard room at the department of General Legal Theory. The legal practitioners may either come to the room at the department of General Legal Theory, or the experimenter may come to them, dependent on their preference. After welcoming the subject the experimenter provides a short explanation about the purpose of the research, the course of the experiment and what is expected from the subject. It is also explained to the subject that the data are to be handled with strict confidentiality. The subject is provided with paper and pencil in case s/he wants to make notes.

3.2 Instructions

All subjects are asked to bring their lawbooks.³ After the introduction the experimenter presents the first legal decision and asks the subject to comprehend the legal decision and to say aloud everything that comes to mind (see Fig. 1).

Instruction by the experimenter
In Dutch: welkom eh het is vandaag 4 november 2011 10.00 eh [naam proefpersoon] de eh bedoeling is dat je een eh een rechterlijke beslissing een uitspraak die geef ik je zo eh dat je die gaat eh bekijken en probeert te begrijpen waar eh het over gaat en dat je bij dat proces eh te werk gaat zoals je gewend bent te werk te gaan als je een uitspraak eh bekijkt en dat je daarbij eh zo veel mogelijk wat je doet en wat je denkt en wat je te binnen schiet eh dat je dat hardop eh uitspreekt.

welcome eh today it is the 4th of November 2011 10.00 PM [name subject] the eh idea is that you eh look at a legal decision which I will hand to you in a moment eh that you look at this decision and try to understand eh what it is about and that you in doing so eh go ahead as you are used to when you examine a decision and that you in doing so eh as much as possible verbalize everything you do and think and what comes to mind

3.3 Role of the experimenter

The experimenter is present at each session. The role of the

experimenter is a restrained one.

After the introduction and the instructions the only interference allowed is prompting a subject when s/he stops talking ('keep on talking'). In no way the experimenter is allowed to hint or correct the subject during the process of comprehending the legal decision.

3.4 Recording

A digital voice recorder⁵ is used to record every utterance of both the subject and the experimenter during the session.

The recordings start with the experimenter introducing and explaining the experiment and ends after the experimenter has thanked the subject for his or her participation. The resulting recordings are in MP3 format and are saved with the specific date and time.

3.5 Transcribing

All recordings are typed out completely and verbatim. The impasses, when no one is talking, are also registered using dots between brackets (...) and an indication of the period of time (in seconds).

We present a fragment of a verbatim expert beginner protocol in which the Uitzendburo Cito (Cito Employment Agency) decision has to be comprehended as an example (see Fig. 2).

Fragment of a verbatim expert beginner protocol
In Dutch: ehmm nog een keer kijken wat er in het hoger beroep is gedaan waarbij in hoger beroep een vonnis van de rechtbank ehm maar daar hebben ze hem dus toen vrijgesproken van hetgeen er onder 2 en 3 (... 5 seconden) eh toen wel bewezen was aangenomen als bewezen was aangenomen (... 10 seconden) en dat ze hem dan wel voor het tenlastegelegde 1 en 2 (... 5 seconden) hebben veroordeeld nu gaat het [onverstaanbaar] voorbereidings en uitvoerings eh sorry voorbereidingshandelingen en geen uitvoeringshandelingen waardoor het dan (... 5 seconden) ehm geen poging kan zijn omdat daar zoals ik me kan herinneren een begin van uitvoering moet zijn (... 10 seconden).

ehmm lets have another look what happened in appeal where in appeal the verdict of the court ehm there they have absolved him of what according to 2 and 3 (... 5 seconds) eh had been accepted as proven has been accepted as proven (... 10 seconds) and that they have sentenced him for the alleged under 1 and 2 (... 5 seconds) have sentenced now it concerns [inaudible] preparatory and implementing acts eh sorry preparatory acts and not implementing acts whereby it than (... 5 seconds) ehm cannot be attempt because there as far as I can remember has to be a beginning of implementation (. 10 seconds)

The transcribed protocols are the raw data that need to be analysed.

4 Analysing the protocols

Analysing the data involves the construction or formulation of an interpretation theory, the description of a model of self-report and the coding of the protocols, which is a translation of the protocols in terms of the interpretation theory. Coding means assigning labels to protocol fragments following the coding scheme. The coding scheme or model therefore has to be constructed first.

We will not perform a quantitative, statistical, analysis of the protocols on the basis of a formal coding.

We plan a qualitative analysis using a template to explore the protocols and to compare each protocol with. We do this because we look at the protocols from two different points of view: from the point of view of order or sequence, which also refers to interdependencies and repetitions (reiterations), and from the point of view of content.

In analysing the protocols we first explore the protocols on the basis of the template, followed by a comparison of the protocols with our template. In the exploration we will look at the order or sequence subjects use, which involves an inspection of the subtasks, and the content subjects use, which involves an inspection of the input and output data. After the exploration we compare each protocol with the template also both from the point of view of order and the point of view of content.

We prepare the transcribed protocols for analysis by breaking up sentences in propositions and by rearranging the propositions. The sequence is rearranged when indicated by the subjects or when it appeared 'logically' necessary by the interpreter. The intended sequence is indicated by the subjects' use of indicators or temporal relations (e.g., before, then, first, etc.).

When protocols are obviously incomplete and it is possible to infer what was implied propositions are added. Incompleteness or gaps may relate to processes of which the subject thinks that the experimenter will know what s/he is doing. For example, after reading the legal decision, the subject may not explicitly state his or her understanding of the situation description, because this would merely be a recount of the case description. Another example may be the 'select article' activity. It may appear later on in the protocol that the subject has selected the article because s/he is using it. However, the activity appears difficult to report.

There are also different kinds of verbalizations that are not directly related with comprehending the legal decision. The subject may be talking about issues that have absolutely nothing to do with comprehending the legal decision (for example 'O dear, I must not forget to apply for the criminal law exam.'), verbalizations that refer to

an evaluation of comprehending the legal decision at the meta-level ('This is a difficult case.'), or comments on oneself ('I am a bit nervous.').

4.1 Our template

The template we use in the analysis of the protocols specifies the structured situation description (i.e. proven stated facts), the legal question, the legal rules, the reasoning structure and the conclusion for both legal decisions used in the experiment.⁷ See Fig. 3 for the specification of the content in the Cito Employment Agency decision.

We explore the protocols using the template from the point of view of content. We want to find out if novices have difficulties in comprehending a legal decision and if so if we can attribute these difficulties to insufficient mastery of, or insight in, the subject matter. We therefore first have a look at what knowledge is used. The template describes which elements have to be used. There are basically two possible outcomes:

- the protocol matches the content in the model;
- the protocol does not match the content in the model.

Next we explore the protocols from the point of view of order. See Table 1 below for the specification of order. There are different ways in which a subject may address the issues in the legal decision. A subject may start with selecting the facts (structured situation description 1), with the conclusion (conclusion 1) or with the legal question (legal question/point of law 1).

1 Order of elements addressed in comprehending a legal decision

Structured situation description	1	5	3
Legal rules	2	4	2
Legal question/point of law	3	3	1
Reasoning structure	4	2	4
Conclusion	5	1	5

Template for the Cito Employment Agency decision

legal rules	reconstruction legal solution	proven stated facts
rt. 310 Penal Code rt. 311 Penal Code rt. 312 Penal Code rt. 45 Penal Code	<div> <div>conclusion</div> <div> <p>these behaviours can be seen as a beginning of implementation of the intended crime, as they to their external appearance are to be considered to be focused on the completion of the crime;</p> </div> </div> <div> <div>argumentation (reasoning)</div> <div> <p>IF</p> <p>- as is charged to req. stated proven</p> <p>- someone intends to commit in an office the crime of article 312 paragraph 1 of the Penal Code and in order to start implementing this crime rings the bell of that office with partially covered face, a ready to shoot firearm and an empty weekend bag</p> <p>THEN</p> <p>these behaviours are a beginning of implementation of the intended crime, as they are to their external appearance to be considered to be focused on the completion of the crime</p> <p>legal question</p> <p>is there a beginning of implementation?</p> </div> </div>	<p>:</p> <ul style="list-style-type: none"> • 'that he on February 27 1976 • in Amsterdam, • in implementing his intention and the crime to, together and in association with another, • from a plot situated at the Leidsekade, • with the purpose of illegally taking into possession take away money • belonging to 'Cito Employment Agency', • and prior to this theft and/or accompanying this theft with a threat of violence to people present in the Employment Agency • with the purpose to prepare that theft and/or facilitate it • on purpose together and association with another • after he and his accomplice where reasonably certain that an amount of money had been delivered at the named Employment Agency by money transport • and that he and his accomplice had made themselves difficult to recognize by putting on a moped helmet and partially cover their faces with a shawl or piece of sweater • and while his accomplice was in the possession of a ready to shoot firearm with bullets • and he, suspect, [in possession] of an empty bag • has ascended the stone entrance staircase to the front door of fore mentioned Employment Agency and has rang the bell of that closed door, <p>being the implementation of above mentioned crime not performed only due to circumstances independent of both suspects and his accomplices intention</p> <ul style="list-style-type: none"> • that the front door was not opened • and he and his accomplice were arrested on the spot by police officers'

4.2 Example analysis

Here we show an example of the exploration of one of the expert beginners protocols. The subject had to read, structure and analyse the Cito Employment Agency decision. In Fig. 4 we see the results of the expert beginners protocol explored on basis of content.

Expert beginner protocol from the point of view of content

legal rules	reconstruction legal solution	proven stated facts
	<div> <p>conclusion</p> <p>these behaviours can be seen as a beginning of implementation of the intended crime, as they to their external appearance argumentation (reasoning)</p> <p>IF with partially covered face, a ready to shoot firearm and an empty weekend bag</p> <p>THEN these behaviours are a beginning of implementation of the intended crime legal question</p> <p>not implementation acts but still preparatory phase</p> </div>	<ul style="list-style-type: none"> • and while his accomplice was in the possession of a ready to shoot firearm with bullets • and he, suspect, [in possession] of an empty bag • with the purpose of illegally taking into possession • theft • partially cover their faces • rang the bell of that closed door,

In table 2 we see the result of the expert beginners protocol explored on the basis of order. The subject started with picking out the legal question, followed by the structured situation description (the facts of the case), the reasoning structure and the conclusion. We see here that the subject did not address the legal rules.

2 Expert beginner protocol from point of view of order

Structured situation description	2
Legal rules	-
Legal question/point of law	1
Reasoning structure	3
Conclusion	4

What does this teach us? The exploration of this expert beginner protocol shows us that the result is incomplete. The expert beginner does not explicitly refer to the legal rule that is at stake in this case (being article 45 of the Dutch Penal Code). However, referring to the legal rule is essential for really understanding a legal decision. We also see that the expert beginner does not (re)formulate the legal question at stake in this case. In designing instructions for learning to comprehend a legal decision support should be provided on completeness of activities and completeness of content.

5 Summary and future research

Using the Think-Aloud Method is a proven method to gather data to acquire insight in the way experts, expert beginners and novices carry out a certain task. It provides data on differences in task performance, on difficulties experienced in performing a certain task and on ways of carrying out a certain task. These insights can be used to develop instructional materials for learning the specific task, for theory development and for designing software.

At the moment we are engaged in gathering and transcribing the protocols. This will be followed by exploring and coding the protocols on the basis of our template (interpretation theory) both from the point of view of content as from the point of view of order. Then we will analyse the protocols by comparing the protocols both within groups and between groups. These analyses are carried out in order to acquire (more) knowledge and insight in the task of comprehending a legal decision and the knowledge required to be able to perform this task.
